

# Corona Strategy: Fear desired

**Fear is stirred up almost daily by the media coverage of the "Corona crisis". This does not seem to be a coincidence. A scientific study suggests that fear of viruses and bacteria should be manipulated upwards and that various propagandistic means could be used to increase the willingness to vaccinate! See what goals are being aimed at with this report.**

The media stir up fear daily in their coverage of the "Corona crisis". New infection figures are usually mentioned by the Robert Koch Institute without any concrete reference values, like the false positive rate of persons tested. It is also just not mentioned that an infection - meaning virus particles detected by a corona test - is not the same as an illness caused by Covid-19. After all, about 80% of infected persons remain symptom-free [1]. In addition, pictures of large coffins, hearses or graves are used as cover pictures, influencing the emotions of the viewers instead of relating alleged "corona death figures" to everyday deaths. In Germany, for example, an average of over 2000 people die every day. Allegations that corona attacks the nervous system and other organs or causes Kawasaki syndrome, an acute inflammatory disease in children, are spread by the media, without mentioning that other infectious diseases can also cause such consequential damage in rare cases. This is known to every physician, but is hardly ever mentioned in the media, for example in the case of common influenza infections, so that the citizen gets the impression that these consequential damages are new and Corona is therefore particularly dangerous! [2]

So the question is raised: Why do our media report about Corona in such an alarming way? In recent years, personal reports in the population and scientific studies published mainly by alternative media have increasingly criticized the current vaccination practice. In order to be able to counteract this criticism of vaccination practice, so-called infodemiological studies were evaluated after the disdained swine flu vaccination on behalf of the German Federal Ministry of Health. Infodemiology is a new branch of science that aims to actively control health data and information on the Internet. In one such study it is suggested that the fear of viruses and bacteria, which could cause disease, should be manipulated - fear levels raised - and that various types of propaganda could be used to increase the willingness to vaccinate. I quote: "Furthermore, it is often discussed whether so-called fear appeals should be used to increase vaccination rates. Thereby fear is released purposefully, in order to obtain protective behavior. A meta-analysis of the effect of fear appeals shows that they are most likely to bring about a change in behavior, [...]" Further articles in relation to infodemiology research speak of multi-track strategies and behavioral controls to increase the willingness to vaccinate in certain population groups - among other things through so-called "dread-risk communication strategies" - in other words: horror scenarios.

An internal, German government strategy paper recommends the completely unscientific comparison to Spanish flu, even with number games like 2019 = 1919 + 1929. This should remind people: the corona pandemic will be as bad as the Spanish flu and the world economic crisis together if we do not manage to contain it. This paper also recommends

stirring up primeval fears by emphasizing the alleged death by suffocation and making children, as alleged spreaders of infection, afraid that they could be responsible for the death of their grandparents. According to this strategy paper, this is the only way the drastic restrictions on freedom can be enforced.

Professor Drosten also knows how to bring about behavioral changes through fear communication and calls the psychological strategy "Disease Awareness" in an interview. He would like to see the Internet "detoxified", so to speak, by downgrading the channels and sites of so-called "repeat offenders" (e.g. vaccination critics and other educators) so that they are not found, or only with difficulty. This type of censorship is called active monitoring in infodemiology: and is part of health and crisis management.

Why such propaganda is being used to stir up fear of corona can only be explained by looking at the goals that are being targeted:

The EU already started to develop a vaccination roadmap before 2019, which includes the introduction of an electronic vaccination card in addition to the systematic monitoring of the population with regard to their vaccination behaviour and their attitude towards vaccination. See also the broadcasts "Vaccination - the pioneer of global digital identification" and: "The perfidious plan of the World Economic Forum 2020". Here Kla.TV shows how these developments lead to a threatening "behavioral control" of humanity.
